Coldrooms 11 & 12 Emergency Escape Alarms

Coldrooms 11 & 12 at Plant 1 each have an emergency escape alarm if you’re unable to open the door from within or need emergency assistance. When the alarm is triggered, a loud siren / strobe light will activate outside the room.

**Alarm Location:**
- The siren / strobes are positioned outside each coldroom on the wall near the doors.
- Pull cables are located inside each coldroom to the right of the door near the door handle.

**Note:** The cable runs from the floor upwards in case the person activating it isn’t able to stand upright.

**Activate Alarm:**
1. Pull the pull cable towards your body
2. Siren and strobe light activate

When you hear the siren or see the strobe activate, open the door to see if someone needs assistance. If you’re unable to open the door, get help from a co-worker, mechanic or supervisor.

**Reset Alarm:**
1. Push the black button near the pull cable inwards
2. Siren and strobe deactivate

**Remember:**
Check the CO2 alarm panel before entering coldroom 11. The panel has a built in sensor to monitor carbon dioxide levels in the room. If the warning light is on and/or the audible alarm is sounding, with coldroom fans “on”, fully open the door and wait until the oxygen level returns to normal. The panel “warning” light will turn off and audible alarm will stop sounding.

*Note: The coldroom emergency escape alarms are tested monthly to help ensure problem free operation.*
